What is it? And why do you need it?

>> The unified SASE difference

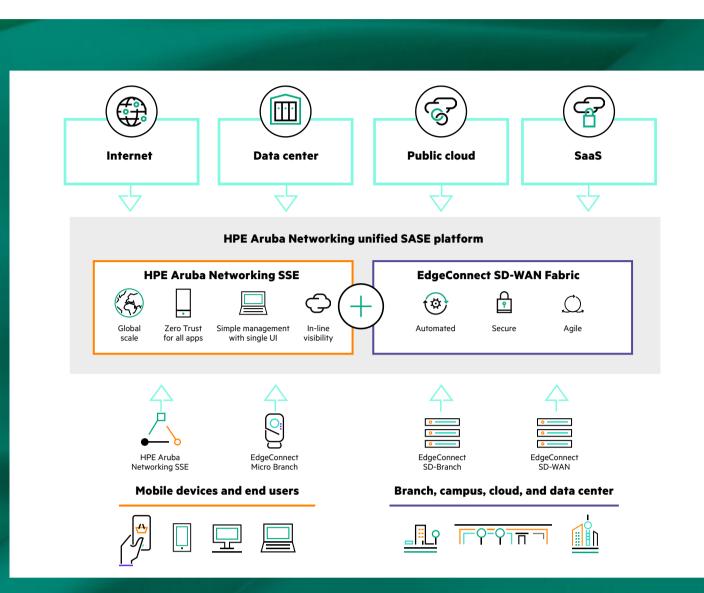

Tackle today's networking challenges with a single-vendor security solution that evolves secure connectivity.

>> Single-vendor SASE evolves secure connectivity

- Market Ma consolidated, secure, anywhere connectivity to applications and data
- Overcome challenges of loosely integrated multiple point solutions, which can introduce latency, performance issues, and management overhead
- Enable greater agility and faster deployment, increasing time-to-value

Today's network architects, IT leaders, and security professionals face significant challenges.

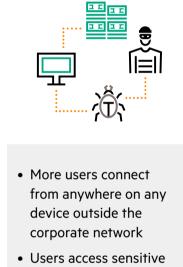

>> Why do you need SASE?

Hybrid working is the new norm

- Security perimeter is dissolving Most applications have moved to the cloud

Increased High operational costs Poor user experience and risks and inefficiencies

Organizations are facing multiple issues

- data in the cloud leading to potential data leaks Internet users are prone to web-based attacks
- The number of IoT devices has exploded increasing the attack surface

including ransomware

and phishing attacks

SASE solves these issues. And unified SASE simplifies the journey.

more resources and time on managing the infrastructure and resolving issues

Benefits of unified SASE

Unified SASE leverages identity-driven and granular Zero Trust access to grant least-privilege access for users, devices, and applications.

Meet HIPAA/SOX standards, automate processes,

reduce human error, and increase efficiency.

Least-privilege access with role and

user identification

Protection against web-based threats and data breaches

Unified SASE protects against malicious web traffic by monitoring and inspecting all web traffic. It performs malicious code detection and web access control. It ensures sensitive data remains

protected and prevents data from being lost.

Built-in next-generation firewall increases security in branch offices The addition of NGFW to SD-WAN lets you safely remove physical firewalls and routers to reduce costs and your attack surface in branch offices.

Intelligent routing improves application performance SD-WAN guarantees a secure, high-performance, low-latency connection to applications and resources by dynamically selecting the

fastest connectivity path.

IoT, and OT initiatives. Virtual deployment means no more need to buy hardware

to support your network.

Ideal gateway for small edge/branch sites The new EC-10104 branch gateway platform is a cost-effective solution for small edge/ branch sites. Typical WAN bandwidth capacity ranges from 2-500Mbps and supports up to 100Mbps of WAN optimization.

and needs

Flexible licensing suits your budget

Flexible licensing lets you right-size your unified SASE solution to fit your business, with the freedom to adapt over time. This makes SASE available at a significantly lower entry point—one that challenges other vendors.

Single-vendor simplicity For businesses the size of yours, a singlevendor solution makes good sense. Get a single, tightly integrated platform that connects and protects your network, plus simplified management and administration.

Experience how unified SASE makes your job easier and solves your biggest challenges by taking a test drive today.
